

Script to Automatically Detect and Restart Linux PPTP Client

The default PPTP client for Linux does not automatically start on boot, or restart on a failed or dropped connection. I have written a short script to ping your VPN server gateway IP address and start the PPTP client if a ping does not succeed.

Create this script and make it executable:

```
1                               2                               vi                               /
```

Add the below script to the file and change the following attributes for your own values:

- **your-vpn-host-or-ip-address**
- **your-vpn-username**
- **your-vpn-password**

```
1                               2                               3                               4
```

Add the following entry to your cron to execute the script every minute.

```
1                               crontab                               -                               e
```

```
1                               *                               /                               1
```
