

Below is my note on installing the common extensions (assuming php-pear has been yum installed):

ImageMagick

```
$ yum install gcc $ yum -y install php-devel # install imagemagick binary $ yum install ImageMagick $ yum install ImageMagick-devel # install php extension $ pecl install imagick # update configuration file $ echo "extension=imagick.so" > /etc/php.d/imagick.ini # restart httpd $ sudo service httpd restart
```

MCrypt

```
# install Epel repo for yum $ sudo rpm -ivh http://dl.fedoraproject.org/pub/epel/6/i386/epel-release-6-7.noarch.rpm $ yum install php-mcrypt
```

Memcached

```
# install memcached library $ sudo yum install memcached # add to system startup $ sudo chkconfig memcached on $ sudo /etc/init.d/memcached start # install php extension $ sudo yum install php-pecl-memcached $ sudo service httpd restart
```

APC

```
$ sudo yum -y install php-pecl-apc
```

PHP-SOAP

```
$ sudo yum install php-soap
```
