Windows tries to use 6to4 and Teredo automatically, not always resulting in a good IPv6 experience. To disable both, execute these commands:

netsh interface ipv6 6to4 set state disabled netsh interface teredo set state disabled

On Windows XP *teredo* isn't a context inside *interface*, but rather a setting in *ipv6*:

netsh interface ipv6 set teredo disabled

3. You may need to reboot, depending on your version of Windows.

If you wish to re-enable Teredo at some point you can issue the command:

netsh interface teredo set state type=default
